

Blackcurrants and prestigious names - Les Deux Ormes

Varieties Andega and Andorine, with the Chapel of Ormoy in the background

None or only few of our readers may ever have heard about the farm called “Les Deux Ormes”. But to those who are a little familiar with France and history, some of the following names will mean something. There is Chartres, Guillaume (William), Madame de Maintenon, Versailles, Néron (Nero) - and blackcurrants. The link is not very strong, but still...

William from “Les Deux Ormes”

When I went to Guillaume Marie’s farm “Les Deux Ormes” earlier this year, I hadn’t thought of any link with the first Norman King of England, William the Conqueror. But after my visit, I became aware of a governing principle: illustrious names! The village I was heading to is called “La Place” – The Place. Nothing more, nothing less. Apparently, there is no need to add anything: it is THE place!

La Place belongs to a township called “Néron” – Nero. This is the name of the famous last Roman Emperor of the Julio-Claudian dynasty.

And Néron is close to the renowned city of Chartres with its Gothic cathedral. It is one of the finest and best preserved cathedrals in Europe, a UNESCO World Heritage Site.

Chartres is situated in the fertile plain of “Beauce”, which is also called the granary of France. In sum, this place, a hundred kilometers South of Paris, is made for conquering the world with prestigious blackcurrants, planted by Guillaume (William, in English)!

A typical farm in the Beauce

Guillaume is farming a total of 440 hectares with two permanent employees. The general structure is quite standard. “For being profitable when you grow wheat, corn and the like, you need 200 hectares per person”, Guillaume says. The farmland belongs to himself and several members of his family. The biggest share of the land (180 hectares) is planted with wheat (durum and common wheat). He also grows rapeseed on more than 60 hectares, and immediately after this come currants: red and black currants, on 40 hectares. On the remaining land, we can find potatoes, onions, beetroots, fava beans, flax, corn, peas and barley.

One of Guillaume’s employees

Guillaume checking his blackcurrants

Blackcurrants are unusual for the region

“We have decreased the share of blackcurrants over the last years”, explains Guillaume. “My family (father, 2 brothers and cousins of mine) had been farming blackcurrants and red currants as a diversification to cereals since the end of the 1980ies, on more than 100 hectares. Nobody else in this region grows currants. In the beginning, blackcurrants were much in demand, and prices were good. We belonged to an association called Sopafruits. The market for our products was of course France, but many blackcurrants were also exported. When Poland became a market economy in the early 1990ies, and finally joined the EU in 2004, the prices for our blackcurrants on the general market fell significantly.”

Les Deux Ormes

Guillaume had studied agricultural engineering and had not worked on the family farm at first. After his studies and for ten years, he had worked as director of a nursery for vegetable products and aromatic herbs in Morocco. When he came back to France in 2010, he took over the family farm. He has chosen the name “Les Deux Ormes”, which literally means “The Two Elms”, because the family farm brings together two places: the farm buildings and the dwelling-house where Guillaume lives with his family, and where an old elm tree had been standing for years. And his father’s farm one kilometer away, called “Ormoy”.

Ormoy

Where is Madame de Maintenon?

Ormoy, a chapel and farm buildings, had formerly belonged to Madame de Maintenon. The village of Maintenon with its chateau is in fact just 5 kilometers away. Françoise d'Aubigné had bought it - which is how she got the title of "Marquise de Maintenon". This lady lived in the 17th century - and was actually the second mistress and wife of Louis XIV (the Sun King, who had built Versailles). Some of this famous king's illegitimate children were partly raised in Maintenon.

Blackcurrant growing by Guillaume

Leaving French history behind, we come back to Guillaume's farm and his currants. He grows 40% of red currants, of varieties Jonkheer, Junifer and Rovada. But our focus is on the 60% blackcurrants. Guillaume mainly grows the varieties which the cassis liqueur producers in France need: Blackdown, Andorine, Andega, Andelène, and some Tiben. "The fruit association we belonged

to does not exist any more. We now are part of Vergers d'Anjou", says Guillaume.

Vergers d'Anjou is a cooperative for arboriculture and other fruits, spreading over four cereal producing regions in Northern and Western France. Storing, packaging and dispatching apples, pears, black and red currants, cherries and plums is their specialty. They will host the next international blackcurrant conference in Angers 2018. "Many of the farmers in this cooperative live and work far away from the head office of Vergers d'Anjou. But this allows us to be competitive with small amounts of fruits, compared to other producers."

Technical aspects

Guillaume loves his blackcurrants - even if they represent a tiny share of his business. During the harvest, which lasts three weeks, he needs to employ more people: there are two shifts of 8 people, one for the early morning work, one in the afternoon. Sometimes, Guillaume needs to irrigate his blackcurrants.

He generally rents hives for a better pollination. Rapeseed and blackcurrants grow not far from each other, they both attract bees and bumblebees. When he plants new fields of blackcurrants, Guillaume doesn't use plastic any more. "I used to plant them under plastic foil before, but I have stopped this. There will be weeds anyhow, and removing them is more complicated with plastic around", explains Guillaume.

New plantings of Rovada

Variety Blackdown

Growing blackcurrants is important for Guillaume, and he is well aware of their potential for our health. Nevertheless, he is not very optimistic for the future. “Not enough people buy blackcurrants - or rather blackcurrant products - because we do not yet sell them as IQF in France. I don’t know for how long I will continue, but I hope it will turn to the better.”

Guillaume does not yet have problems with scales, like other growers further South in France are experiencing. The climate is not the same, and plantations around are different. Luckily, the cassis producers in France can find their favourite varieties from this grower farthest North in France.
